Redmine

Redmine is open-source software for project management and issue tracking. It supports many projects, tasks, time tracking and version control systems. It also lets you make custom reports and connect Redmine to many other tools.

Supported Versions

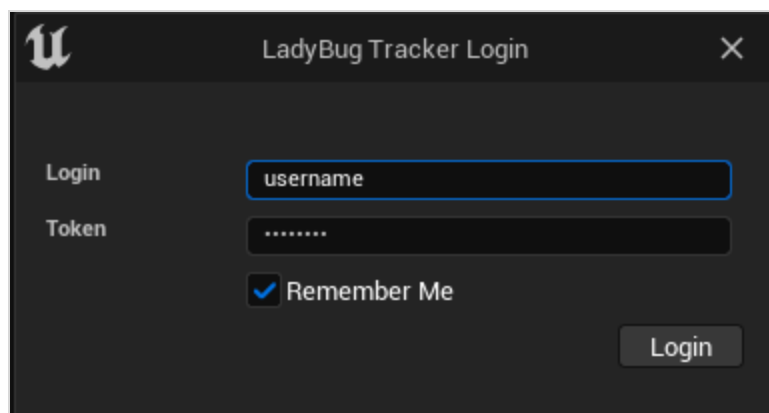

The Redmine API changes from version to version. Thus it is possible that a plugin that works with an older version does not work correctly with a later version.

At this time, version 4.x is the only supported version and the only tested version.

In theory, version 5.x also works, but it is not tested.

Authentication

The Redmine integration uses a login and a password.

The screenshot shows a dark-themed login window titled "LadyBug Tracker Login" with a close button (X) in the top right corner. In the top left corner is a logo consisting of two stylized 'u' characters. The window contains two input fields: the first is labeled "Login" and contains the text "username"; the second is labeled "Token" and contains a series of dots representing a masked password. Below these fields is a checkbox that is checked, with the label "Remember Me". A "Login" button is located in the bottom right corner of the dialog.

Project setup (Redmine service)

LadyBug Tracker needs two custom fields in the project: **Level** and **Camera**. Both fields must have the type **Text**.

To add these fields, do these steps:

1. Open the **Administration** panel, then open **Custom fields**.
2. Click **New Custom Field**, select **Issues**, then click **Next**.
3. Set **Format** to **Text**, and set **Name** to **Level**.
4. Select the project that gets this field.
5. Select the applicable **Trackers**. Usually, this is **Bug**.
6. Click **Create**.

Then do these steps again for the **Camera** field.

Redmine Search:

Project setup (Unreal Engine)

The Redmine server gives the definitions of custom fields only to users with admin accounts. The plugin needs these definitions to work correctly. Thus the project settings must also contain these definitions, in the LadyBug Tracker - Redmine section.

If you do not have admin rights, you must enter this data manually. If you have an admin account, the plugin gets this data from the server automatically, and saves it in the project settings. The project settings are in Config/DefaultBugTracker.ini. Thus you can share this data with the team.

▼ Custom Fields	17 Array elements	⊕	🗑
▼ Index [0]	9 members	▼	
Format	Text	▼	
Name	Level		
Description			
Required	☐		
Multiple values	☐		
Default value			
Possible values	0 Array elements	⊕	🗑
User Role	Manager,Developer,Reporter,Viewer,Test		
Version Status			

Even with an admin account, the plugin cannot get all of the data.

For fields of the type user, you must always enter the **User Role** field manually.

For fields of the type Version, you must also always enter the **Version Status** field manually.
